

**A
Project Report
On
“ONLINE TOURISM MANAGEMENT SYSTEM”**

SUBMITTED BY

Ms: Karishma Rajan Gupta (4423002294)

Ms: Aarti Lalbahadur Gupta (4423002353)

(Bachelor of Computer Application)

To,

University of Tilak Maharashtra Vidyapeeth

(2025 - 2026)

OM SAI INFOTECH

OMKAR INFOTECH

TITLE OF PROJECT

**“ONLINE TOURISM MANAGEMENT
SYSTEM”**

DATE :- 02-05-2025

Director Recommendation

To,
The Register,
Tilak Maharashtra University,
Pune.

**Subject: - Request approval of BCA III (Sem - VI) Project
Report**

We are recommending the report entitled -“ **ONLINE TOURISM
MANAGEMENT SYSTEM**” prepared by **Ms. Karishma Gupta and Ms.
Aarti Gupta** As per partial fulfillment of university requirement for the
award of Bachelor of Computer Application (BCA III, Sem - VI)
degree of **TILAK MAHARASHTRA VIDYAPEETH, OM SAI
INFOTECH.**

Om Sai Infotech Office 303 Saptashree Guruprerna Opp. Gaodevi Ground
Thane Station(west)

Omkar Infotech Office 202 Saptashree Guruprerna Opp. Gaodevi Groun
d Thane Station (West)

DATE :-22-05-2025

CERTIFICATE

This to certify that **Ms: Karishma Gupta and Ms: Aarti Gupta** of T.Y.BCA have satisfactorily completed the project entitled **“ONLINE TOURISM MANAGEMENT SYSTEM”** and submitted in partial fulfillment of requirement for the award of BCA III year (Semester – VI) during the academic year 2024 – 2025 is record of students own work carried out under my supervision and Guidance.

(Director)

Mrs. Anjali Phatak

(Project guide)

ACKNOWLEDGEMENT

ACKNOWLEDGEMENT

We extend our heartfelt gratitude to our esteemed lecturer, Mrs. **Anjali Mam**, whose guidance and teachings have laid the foundation for our understanding of system development. Her expertise in various software development methodologies and her introduction to UML Design have been invaluable in shaping our project.

In addition, we would like to express our sincere appreciation to all those who have supported us throughout the completion of this project. We are grateful for the unwavering assistance provided by the faculty of the department, whose support enabled us to conduct the necessary research and overcome obstacles.

Furthermore, we wish to acknowledge the invaluable contributions of Mrs. **Kavita Mam**, Her insights and encouragement have played a significant role in our project's development, and we are truly thankful for her mentorship.

Finally, as we celebrate the successful completion of our assignment within the stipulated timeframe, we extend our thanks to all individuals who have lent their expertise and assistance along the way. Their collaborative spirit and helpful attitude have been instrumental in our journey.

INTRODUCTION

INTRODUCTION

The Tourism Management System is a web-based software application designed to simplify and automate the activities of a travel and tourism agency. In the traditional system, customers must visit various offices or contact multiple agents to gather travel information and make bookings, which is often time-consuming and inefficient. To overcome these limitations, the Tourism Management System provides an easy-to-use online platform where users can view tour packages, make reservations, raise enquiries, and manage their travel information conveniently.

This system includes modules for administrators, registered users, and guest users, enabling efficient management of tour packages, bookings, complaints, and user profiles. It enhances data accuracy, reduces manual effort, improves customer service, and ensures a secure and responsive interface for both users and administrators. Built using PHP, MySQL, and Apache, the system offers a centralized solution for modern tourism management needs.

application developed to automate the operations of travel and tourism agencies. It allows users to view tour packages, make bookings, raise enquiries, and manage their profiles online. The system simplifies travel planning, reduces manual effort, and ensures secure and efficient data handling. Built with PHP and MySQL, it provides user-friendly features for both customers and administrators.

A dynamic, web-based platform designed to streamline the operations of travel agencies and enhance the user experience for travelers. Traditionally, planning a trip required visiting multiple agencies, gathering information manually, and dealing with time-consuming processes. This system overcomes those challenges by offering an online solution where users can easily browse tour packages, make bookings, manage profiles, raise issues or enquiries, and track tour history — all from a single interface.

Developed using PHP, MySQL, and Apache, the system supports multiple user types, including administrators, registered users, and guests. Administrators can manage packages, bookings, user details, and website content, while users enjoy personalized access to services. The system improves accuracy, reduces manual errors, enhances security, and provides efficient data management. It is a scalable and user-friendly solution for modern tourism business needs.

OBJECTIVE:

- ☐ The objective of the project is to develop a system that automates the processes and activities of a travel and tourism agency.
- ☐ The purpose is to design a system using which one can perform all operations related to traveling and sight-seeing.

EXISTING SYSTEM:

- ☐ In the present system a customer has to approach various agencies to find details of places and to book tickets.
- ☐ This often requires a lot of time and effort.
- ☐ A customer may not get the desired information from these offices and often the customer may be misguided.
- ☐ It is tedious for a customer to plan a particular journey and have it executed properly.

PROPOSED SYSTEM:

- ☐ The proposed system is a web based application and maintains a centralized repository of all related information.
- ☐ The system allows one to easily access the relevant information and make necessary travel arrangements.
- ☐ Users can decide about places they want to visit and make bookings online for travel and accommodation.

STUDY OF THE SYSTEM:

To provide flexibility to the users, the interfaces have been developed that are accessible through a browser. The GUI'S at the top level have been categorized as

1. Administrative user interface
2. The operational or generic user interface

The 'administrative user interface' concentrates on the consistent information that is practically, part of the organizational activities and which needs proper authentication for the data collection. These interfaces help the administrators with all the transactional states like Data insertion, Data deletion and Date updation along with the extensive data search capabilities.

The 'operational or generic user interface' helps the end users of the system in transactions through the existing data and required services. The operational user interface also helps the ordinary users in managing their own information in a customized manner as per the included flexibilities.

FEASIBILITY STUDY:

FEASIBILITY REPORT:

Preliminary investigation examines project feasibility; the likelihood the system will be useful to the organization. The main objective of the feasibility study is to test the Technical, Operational and Economical feasibility for adding new modules and debugging old running system. All systems are feasible if they are given unlimited resources and infinite time. There are aspects in the feasibility study portion of the preliminary investigation:

- Technical Feasibility
- Operation Feasibility
- Economical Feasibility

TECHNICAL FEASIBILITY:

The technical issue usually raised during the feasibility stage of the investigation includes the following:

- Does the necessary technology exist to do what is suggested?
- Do the proposed equipments have the technical capacity to hold the data required to use the new system?
- Will the proposed system provide adequate response to inquiries, regardless of the number or location of users?
- Can the system be upgraded if developed?

OPERATIONAL FEASIBILITY:

Proposed projects are beneficial only if they can be turned out into information systems, which will meet the organization's operating requirements. Operational feasibility aspects of the project are to be taken as an important part of the project implementation. Some of the important issues raised are to test the operational feasibility of a project includes the following: -

- Is there sufficient support for the management from the users?
- Will the system be used and work properly if it is being developed and implemented?
- Will there be any resistance from the user that will undermine the possible application benefits?

This system is targeted to be in accordance with the above-mentioned issues. Beforehand, the management issues and user requirements have been taken into consideration. So there is no question of resistance from the users that can undermine the possible application benefits.

The well-planned design would ensure the optimal utilization of the computer resources and would help in the improvement of performance status.

ECONOMIC FEASIBILITY:

A system can be developed technically and that will be used if installed must still be a good investment for the organization. In the economical feasibility, the development cost in creating the system is evaluated against the ultimate benefit derived from the new systems. Financial benefits must equal or exceed the costs. The system is economically feasible. It does not require any additional hardware or software.

FUNCTIONAL REQUIREMENTS:

Number of Modules

After careful analysis the system has been identified to have the following modules:

- 1. Administrator module**
- 2. User(Traveler) module**
- 3. Guest user**

1. ADMINISTRATOR MODULE:

This module provides administrator related functionality. Administrator manages all information and has access rights to add, delete, edit and view the data related to places, travels, routes, bookings, Enquiries etc.

Packages—Admin will create the packages and Manage the packages (Create, Update, delete)

Users- Admin views all Information of all users.

Booking- Admin will responsible for manage booking. Admin can confirm and cancel a booking of traveler.

Manage issues/ Complaints—Admin can take action on any issue /complaint raised by user (traveler) and Put remark.

Manage Enquiries—admin can manage all enquiries raised by users (traveler).

Manage pages- Admin can edit the info of all pages that are display on the website,

Dashboard- Here admin can view all count of booking, issues, Enquiries and Users.

Change password--- Admin can change own password.

2. USER (TRAVELLER) MODULE:

Signup- User can register yourself for booking.

Sign in- Here user can login with valid username and password.

Forgot Password—User can recover his/her own password.

My Profile- user can update own profile.

Tour history-After login user can book any tour that will show in Tour history. User can cancel his/her booking before 24 hr of travelling.

Change Password --- User can own Password.

Write-use—here user can raise any issue related to booking. Cancellation etc.

3. Guest MODULE:

Guest user can visit the website and view the all content of website. Guest user can also Enquiry.

SYSTEM ENVIRONMENT

2.1 Hardware Configuration

1. Pentium IV Processor
2. 512 MB RAM
3. 40GB HDD
4. 1024 * 768 Resolution Color Monitor

Note: This is not the “System Requirements”.

2.2 Software Configuration

1. OS : Windows XP
2. PHP Triad (PHP5.6, MySQL, Apache, and PHPMyAdmin)

2.3 Software Features

2.3.1 PHP TRIAD

PHPTriad installs a complete working PHP/MySQL server environment on Windows platforms (9x/ NT). Installs PHP, MySQL, Apache, and PHPMyAdmin.

2.3.1.1 PHP

PHP (Hypertext Preprocessor) is a widely-used open-source server-side scripting language designed primarily for web development. It was originally created by Danish-Canadian programmer Rasmus Lerdorf in 1994 and has since been continuously developed by a large community of developers.

PHP is particularly well-suited for creating dynamic web pages and web applications. It can

cookies, and perform many other tasks necessary for web development. PHP code is usually embedded directly into HTML documents, allowing developers to mix PHP code with HTML seamlessly.

Some key features of PHP include:

1. Open Source: PHP is free to use and has a large community of developers contributing to its development and support.

2. Cross-Platform: PHP runs on various platforms, including Windows, Linux, macOS, and many others.

3. Server-Side Scripting: PHP scripts are executed on the server, generating HTML which is then sent to the client's browser. This allows for dynamic content generation.

4. Database Integration: PHP has built-in support for working with databases like MySQL, PostgreSQL, SQLite, and others, making it easy to create database-driven web applications.

5. Extensive Library Support: PHP has a vast ecosystem of libraries and frameworks that provide pre-built functions and modules for common tasks, speeding up development.

6. Simple Syntax: PHP syntax is relatively easy to learn and understand, especially for those with a background in C-style languages like C, C++, and Java.

Overall, PHP remains one of the most popular choices for web development due to its versatility, ease of use, and extensive community support.

Usage

PHP is a general-purpose scripting language that is especially suited for web development. PHP generally runs on a web server, taking PHP code as its input and creating web pages as output. It can also be used for command-line scripting and client-side GUI applications. PHP can be deployed

complete source code for users to build, customize and extend for their own use.

PHP primarily acts as a filter, taking input from a file or stream containing text and/or PHP instructions and outputs another stream of data; most commonly the output will be HTML. It can automatically detect the language of the user. From PHP 4, the PHP parser compiles input to produce bytecode for processing by the Zend Engine, giving improved performance over its interpreter predecessor. Originally designed to create dynamic web pages, PHP's principal focus is server-side scripting, and it is similar to other server-side scripting.

languages that provide dynamic content from a web server to a client, such as Microsoft's Active Server Pages, Sun Microsystems' JavaServer Pages, and mod_perl. PHP has also attracted the development of many frameworks that provide building blocks and a design structure to promote rapid application development (RAD). Some of these include CakePHP, Symfony, CodeIgniter, and Zend Framework, offering features similar to other web application frameworks.

The LAMP architecture has become popular in the web industry as a way of deploying web applications. PHP is commonly used as the *P* in this bundle alongside Linux, Apache and MySQL, although the *P* may also refer to Python or Perl.

As of April 2007, over 20 million Internet domains were hosted on servers with PHP installed, and PHP was recorded as the most popular Apache module. Significant websites are written in PHP including the user-facing portion of Facebook, Wikipedia (MediaWiki), Yahoo!, MyYearbook, , Digg, Wordpress and Tagged. In addition to server-side scripting, PHP can be used to create stand-alone, compiled applications and libraries, it can be used for shell scripting, and the PHP binaries can be called from the command line.

2.3.1.1.1 Speed optimization

As with many scripting languages, PHP scripts are normally kept as human-readable source code, even on production web servers. In this case, PHP scripts will be compiled at runtime by the PHP

using PHP compilers as with other programming languages such as C (the language PHP and its extensions are written in). Code optimizers aim to reduce the computational complexity of the compiled code by reducing its size and making other changes that can reduce the execution time with the overall goal of improving performance. The nature of the PHP compiler is such that there are often opportunities for code optimization, and an example of a code optimizer is the Zend Optimizer PHP extension.

Another approach for reducing overhead for high load PHP servers is using PHP accelerators. These can offer significant performance gains by caching the compiled form of a PHP script in shared memory to avoid the overhead of parsing and compiling the code every time the script runs.

2.3.1.1.2 Security

The National Vulnerability Database stores all vulnerabilities found in computer software. The overall proportion of PHP-related vulnerabilities on the database amounted to: 12% in 2003, 20% in 2004, 28% in 2005, 43% in 2006, 36% in 2007, and 35% in 2008. Most of these PHP-related vulnerabilities can be exploited remotely: they allow hackers to steal or destroy data from data sources linked to the webserver (such as an SQL database), send spam or contribute to DOS attacks using malware, which itself can be installed on the vulnerable servers.

These vulnerabilities are caused mostly by not following best practice programming rules: technical security flaws of the language itself or of its core libraries are not frequent. Recognizing that programmers cannot be trusted, some languages include taint checking to detect automatically the lack of input validation which induces many issues. However, such a feature is being developed for PHP

Hosting PHP applications on a server requires a careful and constant attention to deal with these security risks. There are advanced protection patches such as Suhosin and Hardening-Patch, especially designed for web hosting environments. Installing PHP as a CGI binary rather than as an Apache module is the preferred method for added security. With respect to securing the code

2.3.1.1.3 Syntax

```
<html>
<head>
    <title>PHP Test </title>
</head>
<body>
    <?php echo "<p> Hello World </p>"; ?>
</body></html>
```

Note : - Code in bold letters shows the PHP code embedded within HTML. PHP only parses code within its delimiters. Anything outside its delimiters is sent directly to the output and is not parsed by PHP. The most common delimiters are `<?php` and `?>`, which are open and close delimiters respectively. `<script language="php">` and `</script>` delimiters are also available. Short tags can be used to start PHP code, `<?` or `<?=>` (which is used to echo back a string or variable) and the tag to end PHP code, `?>`. These tags are commonly used, but like ASP-style tags (`<%` or `<%=` and `%>`), they are less portable as they can be disabled in the PHP configuration. For this reason, the use of short tags and ASP-style tags is discouraged. The purpose of these delimiters is to separate PHP code from non-PHP code, including HTML.

Variables are prefixed with a dollar symbol and a type does not need to be specified in advance. Unlike function and class names, variable names are case sensitive. Both double-quoted (“”) and heredoc strings allow the ability to embed a variable’s value into the string. PHP treats newlines as whitespace in the manner of a free-form language (except when inside string quotes), and statements are terminated by a semicolon. PHP has three types of comment syntax: `/* */` serves as block comments, and `//` as well as `#` are used for inline comments. The echo statement is one of several facilities PHP provides to output text (e.g. to a web browser).

languages such as C, C++, Java and Perl.

2.3.1.2 MY SQL

What is a database? Quite simply, it's an organized collection of data. A database management system (DBMS) such as Access, FileMaker Pro, Oracle or SQL Server provides you with the software tools you need to organize that data in a flexible manner. It includes facilities to add, modify or delete data from the database, ask questions (or queries) about the data stored in the database and produce reports summarizing selected contents.

MySQL is a multithreaded, multi-user SQL database management system (DBMS). The basic program runs as a server providing multi-user access to a number of databases. Originally financed in a similar fashion to the JBoss model, MySQL was owned and sponsored by a single for-profit firm, the Swedish company MySQLAB now a subsidiary of Sun Microsystems, which holds the copyright to most of the codebase. The project's source code is available under terms of the GNU General Public Licence, as well as under a variety of proprietary agreements.

MySQL is a database. The data in MySQL is stored in database objects called tables. A table is a collection of related data entries and it consists of columns and rows. Databases are useful when storing information categorically. A company may have a database with the following tables: "Employees", "Products", "Customers" and "Orders".

2.3.1.2.1 Database Tables

A database most often contains one or more tables. Each table is identified by a name (e.g. "Customers" or "Orders"). Tables contain records (rows) with data.

2.3.1.2.2 Queries

A query is a question or a request. With MySQL, we can query a database for specific information and have a recordset returned.

2.3.1.2.2.1 Create a connection to a database

Before you can access data in a database, you must create a connection to the database. In PHP, this is done with the `mysqli_connect()` function.

Syntax

`mysqli_connect (servername,username,password);`

Parameter	Description
servername	Optional. Specifies the server to connect to. Default value is "localhost:3306"
username	Optional. Specifies the username to log in with. Default value is the name of the user that owns the server process
password	Optional. Specifies the password to log in with. Default is ""

Example

In the following example we store the connection in a variable (\$con) for later use in the script.

The “die” part will be executed if the connection fails:

```
<?php
$con = mysqli_connect("localhost","peter","abc123");
if (!$con)
{
    die('Could not connect: ' . mysql_error());
}
// some code
?>
```

2.3.1.2.2.2 Closing a Connection

The connection will be closed automatically when the script ends. To close the connection before, use the `mysqli_close()` function:

```
<?php
//database connection
$con=mysqli_connect("localhost","root","","preschooldb");
if(mysqli_connect_errno()){
echo "Connection Fail".mysqli_connect_error();
}
?>
```

2.3.1.2.2.3 Create a Database

The `CREATE DATABASE` statement is used to create a database in MySQL.

Syntax

`CREATE DATABASE database_name`

To get PHP to execute the statement above we must use the `mysql_query()` function. This function is used to send a query or command to a MySQL connection.

2.3.1.2.2.4 Create a Table

The `CREATE TABLE` statement is used to create a table in MySQL

Syntax

```
CREATE TABLE table_name
(
column_name1 data_type, column_name2
data_type, column_name3 data_type,
....
```

2.3.1.2.3 MySQL Functions

`mysql_affected_rows` — Get number of affected rows in previous MySQL

operation `mysql_change_user` — Change logged in user of the active

connection `mysql_client_encoding` — Returns the name of the character set

`mysql_close` — Close MySQL connection

`mysql_connect` — Open a connection to a MySQL

Server `mysql_create_db` — Create a MySQL database

`mysql_data_seek` — Move internal result pointer

`mysql_db_name` — Get result data

`mysql_db_query` — Send a MySQL query

`mysql_drop_db` — Drop (delete) a MySQL

database

`mysql_errno` — Returns the numerical value of the error message from previous MySQL

operation `mysql_error` — Returns the text of the error message from previous MySQL

operation `mysql_escape_string` — Escapes a string for use in a `mysql_query`

`mysql_fetch_array` — Fetch a result row as an associative array, a numeric array,

or both `mysql_fetch_assoc` — Fetch a result row as an associative array

`mysql_fetch_field` — Get column information from a result and return as an

object `mysql_fetch_lengths` — Get the length of each output in a result

wmysql_num_rows — Get number of rows in result

mysql_pconnect — Open a persistent connection to a MySQL
server

mysql_ping — Ping a server connection or reconnect if there is no

connection mysql_query — Send a MySQL query

mysql_result — Get result data

mysql_select_db — Select a MySQL database

mysql_set_charset — Sets the client character

set mysql_stat — Get current system status

mysql_tablename — Get table name of field

mysql_thread_id — Return the current thread

ID

mysql_unbuffered_query — Send an SQL query to MySQL, without fetching and buffering the
result (*See Appendix 2 for more My_SQL Functions.*

2.3.1.4 phpMAdmin

phpMyAdmin is an open source tool written in PHP intended to handle the administration of MySQL over the World Wide Web. phpMyAdmin supports a wide range of operations with MySQL. Currently it can create and drop databases, create/drop/alter tables, delete/edit/add fields, execute any SQL statement, manage users and permissions, and manage keys on fields. While you still have the ability to directly execute any SQL statement, phpMyAdmin can manage a whole MySQL server (needs a super-user) as well as a single database. To accomplish the latter you'll need a properly set up MySQL user who can read/write only the desired database. It's up to you to look up the appropriate part in the MySQL manual.

phpMyAdmin can:

- browse and drop databases, tables, views, fields and indexes
- create, copy, drop, rename and alter databases, tables, fields and indexes
- maintenance server, databases and tables, with proposals on server configuration
- execute, edit and bookmark any SQL-statement, even batch-queries
- load text files into tables
- create and read dumps of tables
- export data to various formats: CSV, XML, PDF, ISO/IEC 26300 - OpenDocument Text and Spreadsheet, Word, Excel and L^AT_EX formats
- administer multiple servers
- manage MySQL users and privileges
- check referential integrity in MyISAM tables

2.3.1.5 Apache Web server

Often referred to as simply *Apache*, a public-domain open source Web server developed by a loosely-knit group of programmers. The first version of Apache, based on the NCSA httpd Web server, was developed in 1995.

Core development of the Apache Web server is performed by a group of about 20 volunteer programmers, called the *Apache Group*. However, because the source code is freely available, anyone can adapt the server for specific needs, and there is a large public library of Apache additions. In many respects, development of Apache is similar to development of the Linux operating system.

The original version of Apache was written for UNIX, but there are now versions that run under OS/2, Windows and other platforms. The name is a tribute to the Native American Apache Indian tribe, a tribe well known for its endurance and skill in warfare. A common misunderstanding is that it was called Apache because it was developed from existing NCSA code plus various patches, hence the name *a patchy server*, or Apache server.

Apache consistently rates as the world's most popular Web server according to analyst surveys. Apache has attracted so much interest because it is full-featured, reliable, and free. Originally developed for UNIX™ operating systems, Apache has been updated to run on Windows, OS/2, and other platforms. One aspect of Apache that some site administrators find confusing — especially those unfamiliar with UNIX-style software — is its configuration scheme. Instead of using a point-and-click graphic user interface (GUI) or Windows Registry keys as most other

Configuration Files

Apache uses a system of three text files for managing its configuration data. All three of these files (almost always) appear in Apache's `./conf` directory and are designed to be edited by system administrators:

1. `httpd.conf` for general settings
2. `srm.conf` for resource settings
3. `access.conf` for security settings

When Apache first starts, these files are processed in the order shown above. Originally, the initial installation of Apache included default entries within each of the three files. In the most recent versions of Apache, however, the default installation has changed. Now `httpd.conf` is treated as the “master” configuration file and it contains all of the settings. Both `srm.conf` and `access.conf` still exist in the installation, but they contain no settings and are empty except for some comments.

Inside `Httpd.conf`

Traditionally `httpd.conf` contained general settings such as the `ServerName` and `Port` number. These entries appear as follows in the file: `ServerName compnetworking.about.com Port 80` The term “httpd” stands for *HTTP Daemon*. Recall that in a UNIX environment, the term *daemon* refers to a type of process designed to launch at system boot and continue running for very long periods of time. This file contains a number of other entries (technically called directives), but for most of these, modifications are optional. Probably the most useful of these entries is `ServerAdmin`.

Access and Security Settings

It is recommended practice now for Apache administrators to manage their resource and security settings from `httpd.conf`. Administrators of older versions of Apache can simply cut their entries from `srm.conf` and `access.conf` and paste them into the master file. If an administrator wants to go one step further and delete the two empty files, they should also place the following entries in

httpd.conf to prevent Apache from attempting to access them.

INPUT DESIGN:

Input design is a part of overall system design. The main objective during the input design is as given below:

- To produce a cost-effective method of input.
- To achieve the highest possible level of accuracy.
- To ensure that the input is acceptable and understood by the user.

INPUT STAGES:

The main input stages can be listed as below:

- Data recording
- Data transcription
- Data conversion
- Data verification
- Data control
- Data transmission
- Data validation
- Data correction

INPUT TYPES:

It is necessary to determine the various types of inputs. Inputs can be categorized as follows:

- External inputs, which are prime inputs for the system.
- Internal inputs, which are user communications with the system.
- Operational, which are computer department's communications to the system?
- Interactive, which are inputs entered during a dialogue.

INPUT MEDIA:

At this stage choice has to be made about the input media. To conclude about the input media consideration has to be given to;

- Type of input
- Flexibility of format
- Speed
- Accuracy
- Verification methods
- Rejection rates
- Ease of correction
- Storage and handling requirements
- Security
- Easy to use
- Portability

Keeping in view the above description of the input types and input media, it can be said that most of the inputs are of the form of internal and interactive. As

Input data is to be the directly keyed in by the user, the keyboard can be considered to be the most suitable input device.

OUTPUT DESIGN:

Outputs from computer systems are required primarily to communicate the results of processing to users. They are also used to provide a permanent copy of the results for later consultation. The various types of outputs in general are:

- External Outputs whose destination is outside the organization.
- Internal Outputs whose destination is with in organization and they are the User's main interface with the computer.

- Operational outputs whose use is purely within the computer department.
- Interface outputs, which involve the user in communicating directly with the system.

OUTPUT DEFINITION

The outputs should be defined in terms of the following points:

- Type of the output
- Content of the output
- Format of the output
- Location of the output
- Frequency of the output
- Volume of the output
- Sequence of the output

It is not always desirable to print or display data as it is held on a computer. It should be decided as which form of the output is the most suitable.

For Example

- Will decimal points need to be inserted
- Should leading zeros be suppressed.

OUTPUT MEDIA:

In the next stage it is to be decided that which medium is the most appropriate for the output. The main considerations when deciding about the output media are:

- The suitability for the device to the particular application.
- The need for a hard copy.
- The response time required.

- The location of the users
- The software and hardware available.

Keeping in view the above description the project is to have outputs mainly coming under the category of internal outputs. The main outputs desired according to the requirement specification are:

The outputs were needed to be generated as a hard copy and as well as queries to be viewed on the screen. Keeping in view these outputs, the format for the output is taken from the outputs, which are currently being obtained after manual processing. The standard printer is to be used as output media for hard copies.

SDLC Methodology:

This document play a vital role in the development of life cycle (SDLC) as it describes the complete requirement of the system. It means for use by developers and will be the basic during testing phase. Any changes made to the requirements in the future will have to go through formal change approval process.

SPIRAL MODEL was defined by Barry Boehm in his 1988 article, “A spiral Model of Software Development and Enhancement. This model was not the first model to discuss iterative development, but it was the first model to explain why the iteration models.

As originally envisioned, the iterations were typically 6 months to 2 years long. Each phase starts with a design goal and ends with a client reviewing the progress thus far. Analysis and engineering efforts are applied at each phase of the project, with an eye toward the end goal of the project.

The steps for Spiral Model can be generalized as follows:

- The new system requirements are defined in as much details as possible. This usually involves interviewing a number of users representing all the external or internal users and other aspects of the existing system.
- A preliminary design is created for the new system.

- A first prototype of the new system is constructed from the preliminary design. This is usually a scaled-down system, and represents an approximation of the characteristics of the final product.
- A second prototype is evolved by a fourfold procedure:
 1. Evaluating the first prototype in terms of its strengths, weakness, and risks.
 2. Defining the requirements of the second prototype.
 3. Planning an designing the second prototype.
 4. Constructing and testing the second prototype.
- At the customer option, the entire project can be aborted if the risk is deemed too great. Risk factors might involved development cost overruns, operating-cost miscalculation, or any other factor that could, in the customer's judgment, result in a less-than-satisfactory final product.
- The existing prototype is evaluated in the same manner as was the previous prototype, and if necessary, another prototype is developed from it according to the fourfold procedure outlined above.
- The preceding steps are iterated until the customer is satisfied that the refined prototype represents the final product desired.
- The final system is constructed, based on the refined prototype.
- The final system is thoroughly evaluated and tested. Routine maintenance is carried on a continuing basis to prevent large scale failures and to minimize down time.

The following diagram shows how a spiral model acts like:

Advantages:

- Estimates(i.e. budget, schedule etc .) become more realistic as work progresses, because important issues discovered earlier.
- It is more able to cope with the changes that are software development generally entails.

Software engineers can get their hands in and start working on the core of a project earlier

Performance Requirements:

Performance is measured in terms of the output provided by the application. Requirement specification plays an important part in the analysis of a system. Only when the requirement specifications are properly given, it is possible to design a system, which will fit into required environment. It rests largely with the users of the existing system to give the requirement specifications because they are the people who finally use the system. This is because the requirements have to be known during the initial stages so that the system can be designed according to those requirements. It is very difficult to change the system once it has been designed and on the other hand designing a system, which does not cater to the requirements of the user, is of no use.

The requirement specification for any system can be broadly stated as given below:

- The system should be able to interface with the existing system
- The system should be accurate
- The system should be better than the existing system

The existing system is completely dependent on the user to perform all the duties.

ENTITY-RELATIONSHIP Diagrams

E-R (Entity-Relationship) Diagram is used to represents the relationship between entities in the table.

The symbols used in E-R diagrams are:

SYMBOL

PURPOSE

Represents Entity sets.

Represent attributes.

Represent Relationship Sets.

Line represents flow

Structured analysis is a set of tools and techniques that the analyst.

To develop a new kind of a system:

The traditional approach focuses on the cost benefit and feasibility analysis, Project management, and hardware and software selection a personal considerations.

Database Design

The data in the system has to be stored and retrieved from database. Designing the database is part of system design. Data elements and data structures to be stored have been identified at analysis stage. They are structured and put together to design the data storage and retrieval system.

A database is a collection of interrelated data stored with minimum redundancy to serve many users quickly and efficiently. The general objective is to make database access easy, quick, inexpensive and flexible for the user. Relationships are established between the data items and unnecessary data items are removed. Normalization is done to get an internal consistency of data and to have minimum redundancy and maximum stability. This ensures minimizing data storage required, minimizing chances of data inconsistencies and optimizing for updates. The MySQL database has been chosen for developing the relevant databases.

Database tables and Structure

Admin Table: This table store the admin login details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	id 	int(11)			No	None		AUTO_INCREMENT
2	UserName	varchar(100)	latin1_swedish_ci		Yes	NULL		
3	Password	varchar(100)	latin1_swedish_ci		Yes	NULL		
4	updataDate	timestamp			Yes	NULL		

tbluser table: This table store the user personal and login details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	id 	int(11)			No	None		AUTO_INCREMENT
2	FullName	varchar(100)	latin1_swedish_ci		Yes	NULL		
3	MobileNumber	char(10)	latin1_swedish_ci		Yes	NULL		
4	EmailId 	varchar(70)	latin1_swedish_ci		Yes	NULL		
5	Password	varchar(100)	latin1_swedish_ci		Yes	NULL		
6	RegDate	timestamp			Yes	current_timestamp()		
7	UpdateDate	timestamp			Yes	NULL		ON UPDATE CURRENT_TIMESTAMP()

tbltourpackages table: This table store the tour package full details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	PackageId 🗝️	int(11)			No	None		AUTO_INCREMENT
2	PackageName	varchar(200)	latin1_swedish_ci		Yes	NULL		
3	PackageType	varchar(150)	latin1_swedish_ci		Yes	NULL		
4	PackageLocation	varchar(100)	latin1_swedish_ci		Yes	NULL		
5	PackagePrice	int(11)			Yes	NULL		
6	PackageFetures	varchar(255)	latin1_swedish_ci		Yes	NULL		
7	PackageDetails	mediumtext	latin1_swedish_ci		Yes	NULL		
8	PackageImage	varchar(100)	latin1_swedish_ci		Yes	NULL		
9	Creationdate	timestamp			Yes	current_timestamp()		
10	UpdateDate	timestamp			Yes	NULL		ON UPDATE CURRENT_TIMESTAMP()

tblbooking table: This table store the user booking details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	BookingId 🗝️	int(11)			No	None		AUTO_INCREMENT
2	PackageId	int(11)			Yes	NULL		
3	UserEmail	varchar(100)	latin1_swedish_ci		Yes	NULL		
4	FromDate	varchar(100)	latin1_swedish_ci		Yes	NULL		
5	ToDate	varchar(100)	latin1_swedish_ci		Yes	NULL		
6	Comment	mediumtext	latin1_swedish_ci		Yes	NULL		
7	RegDate	timestamp			Yes	current_timestamp()		
8	status	int(11)			Yes	NULL		
9	CancelledBy	varchar(5)	latin1_swedish_ci		Yes	NULL		
10	UpdateDate	timestamp			Yes	NULL		ON UPDATE CURRENT_TIMESTAMP()

tblissues table: This table store the user issue details raised by the user.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	id 🗝️	int(11)			No	None		AUTO_INCREMENT
2	UserEmail	varchar(100)	latin1_swedish_ci		Yes	NULL		
3	Issue	varchar(100)	latin1_swedish_ci		Yes	NULL		
4	Description	mediumtext	latin1_swedish_ci		Yes	NULL		
5	PostingDate	timestamp			Yes	current_timestamp()		
6	AdminRemark	mediumtext	latin1_swedish_ci		Yes	NULL		
7	AdminremarkDate	timestamp			Yes	NULL		ON UPDATE CURRENT_TIMESTAMP()

tblenquiry table: This table store the user enquiry details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	id 	int(11)			No	<i>None</i>		AUTO_INCREMENT
2	FullName	varchar(100)	latin1_swedish_ci		Yes	<i>NULL</i>		
3	EmailId	varchar(100)	latin1_swedish_ci		Yes	<i>NULL</i>		
4	MobileNumber	char(10)	latin1_swedish_ci		Yes	<i>NULL</i>		
5	Subject	varchar(100)	latin1_swedish_ci		Yes	<i>NULL</i>		
6	Description	mediumtext	latin1_swedish_ci		Yes	<i>NULL</i>		
7	PostingDate	timestamp			Yes	current_timestamp()		
8	Status	int(1)			Yes	<i>NULL</i>		

tblpages table: This table store the website pages details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	id 	int(11)			No	<i>None</i>		AUTO_INCREMENT
2	type	varchar(255)	latin1_swedish_ci		Yes			
3	detail	longtext	latin1_swedish_ci		Yes	<i>NULL</i>		

Class Diagram

The class diagram shows a set of classes, interfaces, collaborations and their relationships.

Architecture flow :(N-Tier)

N-Tier Applications can easily implement the concepts of Distributed Application Design and Architecture. The N-Tier Applications provide strategic benefits to Enterprise Solutions. While 2-tier, client-server can help us create quick and easy solutions and may be used for Rapid Prototyping, they can easily become maintenance and security night mare The N-tier Applications provide specific advantages that are vital to the business continuity of the enterprise. Typical features of a real life n-tier may include the following:

- Security
- Availability and Scalability
- Manageability
- Easy Maintenance
- Data Abstraction

The above mentioned points are some of the key design goals of a successful n-tier application that intends to provide a good Business Solution.

Definition:

Simply stated, an n-tier application helps us distribute the overall functionality into various tiers or layers:

- Presentation Layer
- Business Logic layer
- Data Link Layer
- Database/Data Store

Each layer can be developed independently of the other provided that it adheres to the standards and communicates with the other layers as per the specifications. This is the one of the biggest advantages of the n-tier application. Each layer can potentially treat the other layer as a 'Block-

Box'. In other words, each layer does not care how other layer processes the data as long as it sends the right data in a correct format.

Fig: N-Tier Architecture

1. Presentation Layer:

Also called as client layer, comprises of components that are dedicated to presenting the data to the user. For example: Windows/Web Forms and buttons, edit boxes, Text boxes, labels, grids, etc.

2. Business Logic Layer:

This layer encapsulates the Business rules or the business logic of the encapsulations. To have a separate layer for business logic is of a great advantage. This is because any changes in Business Rules can be easily handled in this layer. As long as the interface between the layers remains the same, any changes to the functionality/processing logic in this layer can be made without impacting the others. A lot of client-server apps failed to implement successfully as changing the business logic was a painful process.

3. Data Link Layer:

This layer comprises of components that help in accessing the Database. If used in the right way, this layer provides a level of abstraction for the database structures. Simply put changes made to the database, tables, etc do not affect the rest of the application because of the Data Access layer. The different application layers send the data requests to this layer and receive the response from this layer.

4. Database Layer:

This layer comprises of the Database Components such as DB Files, Tables, Views, etc. The Actual database could be created using SQL Server, Oracle, Flat files, etc. In an n-tier application, the entire application can be implemented in such a way that it is independent of the actual Database. For instance, you could change the Database Location with minimal changes to Data Access Layer. The rest of the Application should remain unaffected.

aboutus

Welcome to Tourism Management System!!!

Since then, our courteous and committed team members have always ensured a pleasant and enjoyable tour for the clients. This arduous effort has enabled TMS to be recognized as a dependable Travel Solutions provider with three offices Delhi. We have got packages to suit the discerning traveler's budget and savor. Book your dream vacation online. Supported quality and proposals of our travel consultants, we have a tendency to welcome you to decide on from holidays packages and customize them according to your plan.

Manage Page

The screenshot displays the 'Update Page Data' page within the Tourism Management System (TMS). The interface features a dark sidebar on the left with navigation links: Dashboard, Tour Packages, Manage Users, Manage Booking, Manage Issues, Manage Enquiries, and Manage Pages. The main content area has a green header bar with 'TOURISM MANAGEMENT SYSTEM' and a user profile 'Welcome Administrator'. Below the header, a breadcrumb trail shows 'Home > Update Page Data'. The title 'Update Page Data' is prominently displayed. A 'Select page' dropdown menu is set to '***SELECT ONE***'. The 'Selected Page' is 'Privacy And Policy'. The 'Page Details' section includes a rich text editor with a toolbar and a paragraph of placeholder text. An 'UPDATE' button is located at the bottom of the editor. The footer of the page reads 'TMS. All Rights Reserved | TMS'.

CONCLUSION

The Tourism Management System Project is designed to provide a comprehensive solution to manage and promote tourism activities. The system is built on PHP, and it is designed to facilitate various tasks related to tourism, such as reservation management, itinerary planning, tour management, and customer relationship management.

In conclusion, the project has successfully achieved its objectives of developing a reliable and efficient tourism management system that can be used by tour operators, travel agents, and other stakeholders in the tourism industry. The system has been designed to provide users with a seamless and user-friendly experience, enabling them to manage and promote tourism activities more effectively.

The system offers a range of features and functionalities that cater to the needs of different stakeholders, such as itinerary planning, booking management, customer management, and reporting. These features provide users with a holistic solution that can help them manage their tourism operations more efficiently, reduce costs, and improve customer satisfaction.

Furthermore, the project has identified some areas for improvement and future development. For instance, the system could be expanded to include features such as social media integration, mobile app integration, and advanced reporting capabilities. These enhancements can help to make the system more competitive and better meet the needs of the evolving tourism industry.

In conclusion, the Tourism Management System Project has provided a valuable contribution to the tourism industry. It has demonstrated the potential of PHP as a platform for developing reliable and efficient tourism management systems. The project has also highlighted the need for ongoing development and innovation in the tourism industry to keep pace with the changing needs and expectations of customers and stakeholders.
